MINDSET™

Until now, personal computers have been just fine for taking the drudgery out of your work. But Mindset has developed a new graphics architecture for its personal computer, with a design based on the use of two powerful, custom VLSI chips. So, as well as being an efficient office tool, the Mindset PC is a new creative tool.

Mindset's new graphics capabilities make it faster and more agile than other personal computers. The Mindset also handles the new environmental software better than other personal computers. So you'll be able to concentrate on your business, not the computer's.

But most of all, the Mindset's new architecture gives you the opportunity to express yourself graphically—like no other personal computer. You can draw, animate and give objects color and perspective almost instantly.

All these innovations on the inside of the Mindset are reflected on the outside as well. Mindset is modular, with a wide range of system enhancements. I/O modules slip in and out of convenient ports. And, when you're ready, adding additional memory and disk drives is simple, too.

There's already software on the market advanced enough to take advantage of Mindset's unique capabilities. Much more is on the way. And, of course, you can run today's most popular software—the same programs that run on the IBM® PC.

Mindset. The personal computer that can move and work and play with ideas almost as fast as your mind can.
